

3 SIMPLE WAYS TO GET MOSQUITOES UNDER CONTROL WITH A MID-SEASON START

1

BACK-TO-BACK KNOCKDOWN TREATMENTS

Treatments normally happen on two-week to three-week intervals. When starting mid-season, however, we recommend your first few treatments be performed more frequently for heavier knockdown. Tougher knockdown for the heavy mosquito populations currently living in your yard.

- This would typically mean we perform the second treatment 1-2 weeks after the first round.
- Depending on current conditions, we may advise the third treatment should be performed on a similar cycle, but ultimately, once these first treatments have brought populations to a manageable level, we can shift back to our usual 2-3 week frequency for maintenance treatments.

2

MOSQUITO STATIONS – with the abundance of standing water during peak mosquito season, particularly areas that our technicians cannot treat like neighboring areas, a great tool to reduce mosquito reproduction around your yard are stations. Mosquitoes love to reproduce in standing water.

- The stations we use are designed to distribute a non-toxic active ingredient to the surrounding standing water sources, both in and outside your yard.
- While not every yard needs this, stations are an effective way to pack a powerful extra punch and expand the total area mosquitoes are unable to reproduce in.

3

TEAM EFFORTS – effective mosquito control requires a partnership.

- One of the best things you can do to improve the results of your treatments and ultimately see less mosquitoes in their peak season is to be diligent with removing standing water that accumulates around your yard.
- Whether you avoid overwatering your garden, remove any buckets or equipment that collect water or simply regularly drain a bird bath, all of these activities mean there are fewer opportunities for mosquitoes to breed in your own backyard. This is especially important in the summer when mosquitoes reproduce quicker and in larger numbers.

YOU'VE STARTED YOUR TREATMENTS MID-SEASON. HERE'S WHAT YOU SHOULD EXPECT...

Starting treatments mid-season can be a little bit more of an uphill battle compared to starting at the beginning of the season. But don't worry, we've got you covered! By mid-season, the mosquitoes have a bit of a head start. By this we mean that for weeks now the population has been growing aggressively. On top of that, they've been busy laying thousands of eggs in any small nook or cranny that can hold just the tiniest bit of water, so some extra effort is needed to get mosquito populations under control.

CAN PEST HUNTERS-MOSQUITO HUNTERS HELP?

Of course! Rest assured, you've called the right folks but it's important that appropriate expectations are set.

First, when starting treatments mid-season, keep in mind that the first three-to-four treatments you receive are critical—there is no magic bullet that will eliminate all mosquitoes in a single treatment. Second, there is no one-size-fits-all solution for mosquito control, especially with a mid-season start. Mosquito pressure varies by property and factors like the surrounding landscapes, water features, and even weather conditions will all impact your results. The significance of these factors will often determine just how intensive your mid-season mosquito control strategy must be.

NOW WHAT?

Fear not! Even when treatments don't start until mid-season, Pest Hunters-Mosquito Hunters is up to the task. That said, on the reverse side of this card we've provided some additional measures that you can take to optimize your results at this time of year. To proactively implement any one or more of these custom approaches, please call or email us.
