Email Sending Domain

To maximize email marketing impact, prioritize sender reputation and deliverability. A dedicated sending domain in the LC Email system gives you control over email communications, enhancing brand credibility and reducing spam filter risks. This setup is ideal for customized notification emails and targeting specific categories, ensuring efficient delivery. To avoid conflicts with existing email services, configure your dedicated domain using a subdomain. Dedicated sending domains are key to maintaining a positive sender reputation and achieving effective email marketing with LC Email.

- Add additional MX Record

Some Domain Host Such as Google Domains require can only have one MX record pointing towards a domain. In cases such as this there may be an option within the domain registry to add an additional record where you will need to include the second value.

The screenshot shows a web interface for managing DNS records. On the left is a sidebar with navigation options: Registration settings, DNS (selected), Website, Reports, Email, and Security. Below these are links for 'Get a new domain' and 'Send feedback'. The main content area displays a list of DNS records. The first record is a TXT record for 'support' with a value of '"v=spf1 include:mailgun.org ~all"'. Below it is an MX record for 'support' pointing to '10 mxb.mailgun.org' and '10 mxa.mailgun.org'. At the bottom, a new CNAME record is being created for 'email.support' pointing to 'mailgun.org'. The interface includes buttons for 'Add more to this record', 'Cancel', and 'Save'.

Host	Type	Priority	Value
support	TXT	3600	"v=spf1 include:mailgun.org ~all"
support	MX	3600	10 mxb.mailgun.org
support	MX	3600	10 mxa.mailgun.org
email.support	CNAME	3600	mailgun.org

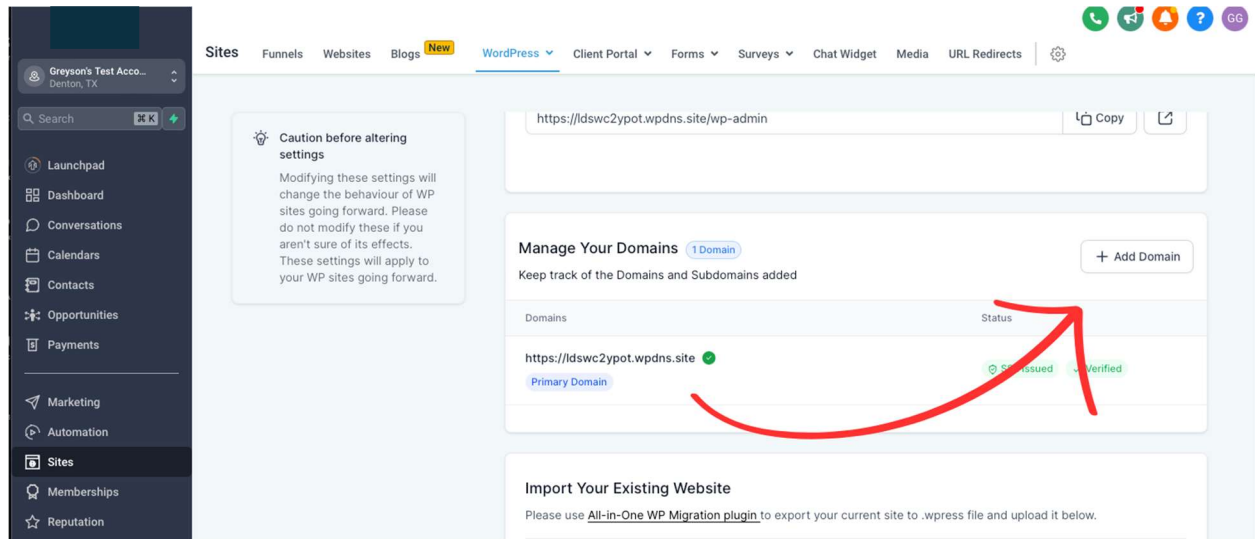

For account email services navigate to the Settings > Email Services > Dedicated Domain
