The Workplace Shift | Beyond the living wall

As we look ahead to 2026, biophilic design is evolving from aesthetic feature to functional strategy.

It's no longer about adding plants at the end of a project. It's about embedding nature into the structure of a space from day one, influencing layout, material selection, acoustics and light.

Integrated living walls, suspended planting systems and timber-led detailing are being used to actively improve environmental performance. These elements help regulate sound, enhance air quality and create spatial zones that feel grounded and intuitive.

Natural textures and layered organic forms are also reshaping how teams experience the workplace, supporting concentration, collaboration and overall wellbeing throughout the day.

In short, nature is becoming operational, not ornamental.
