### The Workplace Shift | Beyond the living wall

As we look toward 2026, biophilic design is becoming more deeply integrated into workplace strategy.

Increasingly, nature is being considered from the earliest stages of design, shaping layout, material selection, acoustics and light as part of a cohesive spatial approach.

Integrated living walls, suspended planting systems and timber-led detailing are being specified not only for their visual qualities, but for their contribution to environmental performance. These elements can help regulate sound, enhance air quality and create spatial zones that feel grounded and intuitive.

Natural textures and layered organic forms continue to influence how teams experience the workplace, supporting concentration, collaboration and sustained wellbeing throughout the day. In short, biophilic design is being applied with greater intentionality, embedded into how a space functions as well as how it feels.
