

Service and capability overview

A practical starting point for organizations exploring cybersecurity, resilience and technical decision support.

Security advisory and leadership

Discuss security priorities, governance, risk assessment, evidence organization and leadership decision support. Existing engagement categories include vCISO services, advisory retainers and project-based consulting.

Security operations and implementation

Explore endpoint protection, patch management, firewall monitoring, vulnerability assessment, cloud security and Zero Trust work. Agree the environment, responsible parties, tools and delivery scope before implementation.

Readiness and compliance support

Clarify applicable obligations, identify consequential gaps, organize available evidence and prioritize remediation. The defense-contractor readiness path provides a scoped 90-day planning and delivery framework.

Post-quantum planning and research

Start with the question: education, cryptographic inventory, transition planning or research collaboration. Demonstrations and emerging technology are described at their evidenced maturity; they are not an assurance of production readiness.

Partner-enabled delivery

Discuss a defined capability gap, product or integration requirement. Product selection, licensing, service availability, responsibilities and support coverage are confirmed during scoping.

Choose an engagement that fits

Managed-service and vCISO categories include Bronze, Silver and Gold, alongside custom advisory and discrete implementation projects. A category is a conversation starting point; deliverables, fees, coverage and commitments belong in the agreed engagement.

Start with the decision you need to make

Tell Josh your organization, the problem, desired outcome and timing. Keep the initial message non-sensitive.
